Delivering Versatility

Simplified Rod Placement

The versatility of the Proficient® Cervical Screw design helps simplify the posterior cervical fixation procedure. The freely-functioning tulip design and self-selecting tri-lobe allows surgeons to place the screw at the preferred anatomical location and trajectory, but still easily align the screw heads for rod placement in a traditional, open or muscle sparing approach.

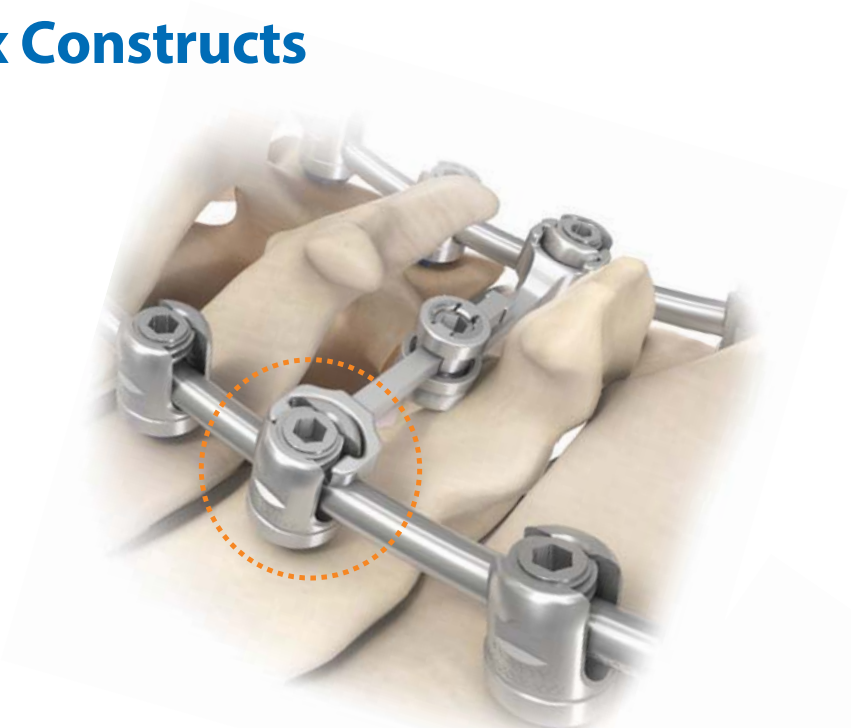

**Freely-functioning tulip design
rotates independently from
screw base and screw shank**

Through Simplicity

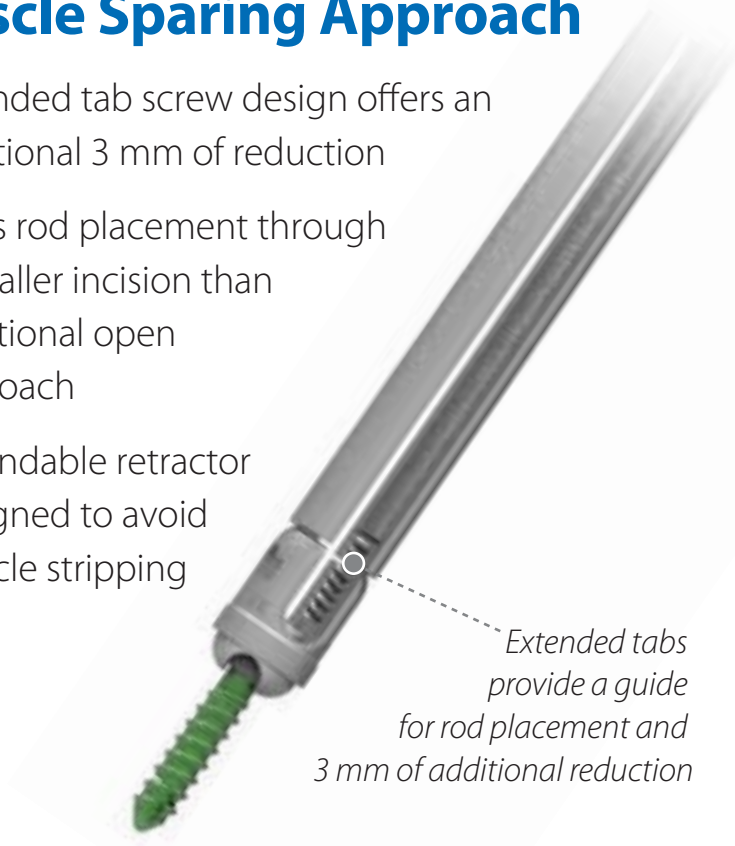

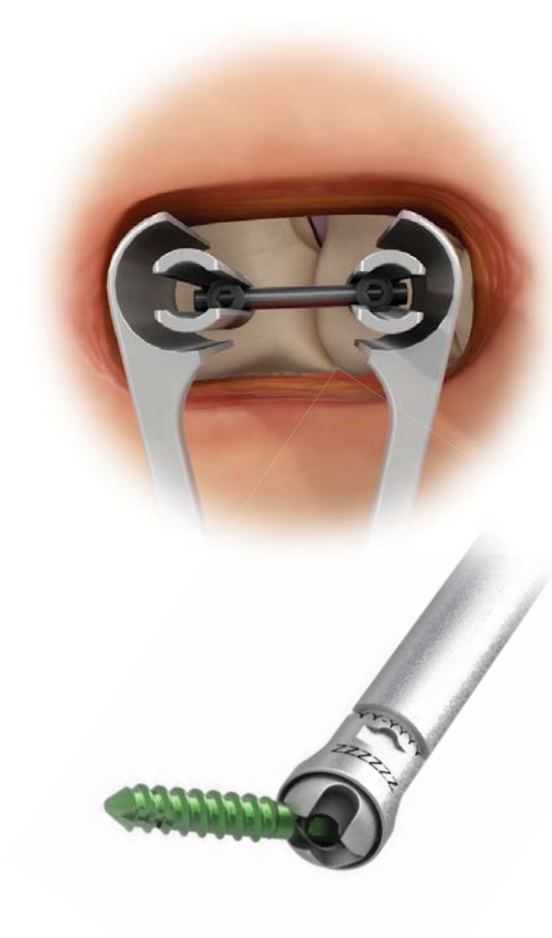

Designed for Complex Constructs

- Screw design accepts 3.5 and 4.0 mm rods
- Rods are offered in Ti and CoCr
- Screw offering includes a 5.5 mm diameter screw that accepts 3.5 or 4.0 mm rods
- Low profile head-to-head cross connector
- Transition rods up to 600 mm

Muscle Sparing Approach

- Extended tab screw design offers an additional 3 mm of reduction
- Eases rod placement through a smaller incision than traditional open approach
- Expandable retractor designed to avoid muscle stripping
